CHAPTER

ONE

ABOUT TIER I TO TIER II DATA EXTRACTION

This report describes the process of extraction of Tier I data for use within the Tier II modeling effort within the *RGVFlood.com* Cyberinfrastructure. This report is produced as part of *TWDB FIF* Deliverable ID 1.2.1.4.3.2.1.

CHAPTER**TWO**

GOALS AND OBJECTIVES

The overarching goal of this work is to develop and deploy procedures for automatically collecting and extracting output data from *WRF-Hydro* for use as input and forcings for the *HEC-RAS*.

- Analyze and characterize the input and output files for the selected Tier I model.
- Evaluate available post-processing tools for extraction and ingestion of Tier I model data.
- Evaluate options for extraction of Tier I model data in real-time.
- Perform a preliminary assessment of the data conditioning needs for Tier I model output.

CHAPTER THREE

WRF-HYDRO DATA FILES

The summaries provided below are adapted from [WRF-Hydro StandAlone](#).

3.1 Input Files (Standalone Mode)

Geographical input data

This data, used by the [WRF WPS](#) `geogrid.exe`, is downloaded from [UCAR WPS GEOG](#) to define the domain's physical location on the globe.

Domain Coordinates

Domain Coordinates define the location of the domain and is used by the [WRF WPS](#) as input in the file 'namelist.wps' to produce GEOGRID files. These can be identified using the [WRF Domain Wizard](#).

Digital Elevation Model/Elevation Data

Input data for the [WRF-Hydro GIS](#) Pre-processing Tool. [DEM](#) data can be obtained from:

- * [USGS HydroSHEDS](#)
- * [National Hydrography Dataset Plus, Version 2](#)
- * [EU-DEM](#)
- * Alternative Sources (NASA, etc)

Forecast Points (optional)

Latitude, Longitude and Station Name, used by the [WRF-Hydro GIS](#) Pre-processing Tool to specify locations for forecast production.

Lake Polygons (optional)

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I Data Extraction for Tier II Modeling Project Deliverable ID 1.2.1.4.3.2.1

Also used by the *WRF-Hydro GIS* Pre-processing Tool to locate lakes and reservoirs.

Meteorological Forcing Data

Meteorological data for the simulation period to “force” the model simulation.

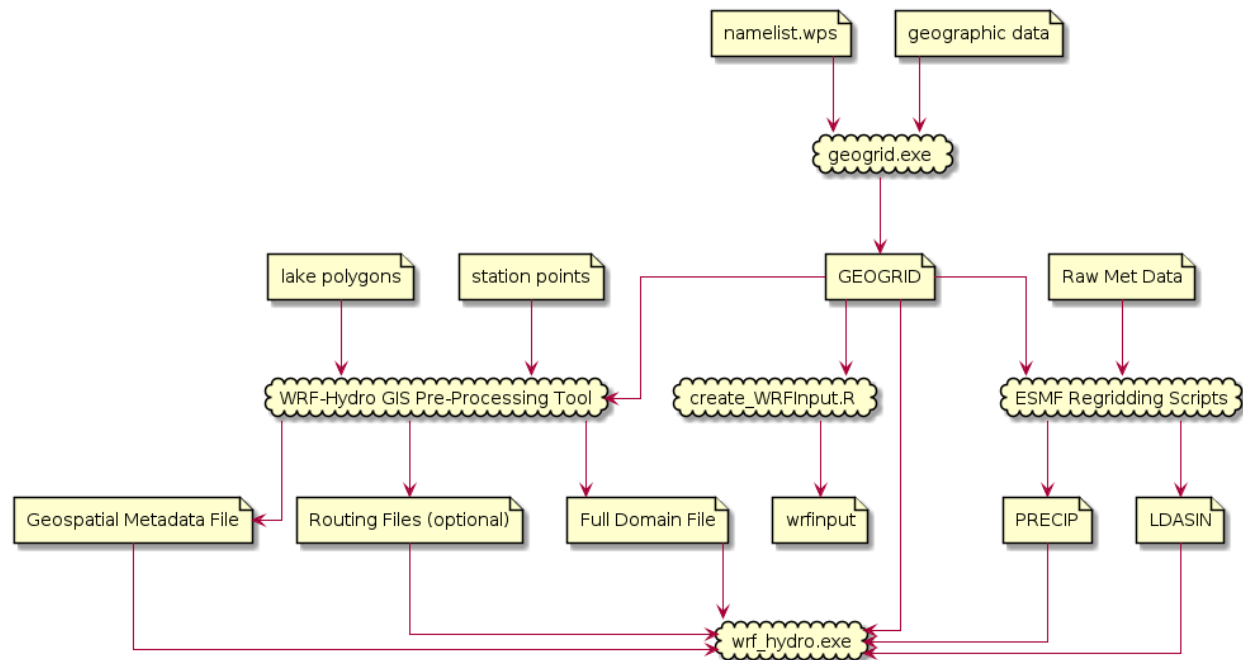

Figure3.1: WRF-Hydro Input Data Flow

3.2 Output Files (Standalone Mode)

The summaries provided below are adapted from *WRF-Hydro Technical Description and User's Guide*

Standard WRF Output

*Standard WRF model output, when run in coupled mode
wrfout”*

LSM Gridded Output

*LSM gridded output (netcdf)
YYYYMMDDHHMM.LDASOUT_DOMAINX*

Model output on the land surface model grid written to a multi-dimensional netcdf data file.

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I Data Extraction for Tier II Modeling Project Deliverable ID 1.2.1.4.3.2.1

Land Surface Diagnostic Output

YYYYMMDDHHMM.LSMOUT_DOMAINX

Channel Network Output

Full channel network output (netcdf point file)

YYYYMMDDHHMM.CHRTOUT_DOMAINX

A netcdf point file containing streamflow discharge, flow depth (i.e. 'stage' or 'head'), longitude, latitude, forecast point index and stream order value for all channel pixels within the high-resolution terrain data file.

Station Observations

Station observations (netcdf point file AND ascii Timeseries)

YYYYMMDDHHMM.CHANOBS_DOMAINX

frxst_pts_out.txt

A netcdf point file containing streamflow discharge, flow depth (i.e. 'stage' or 'head'), longitude, latitude, forecast point index and stream order value for each forecast point specified in the 'frxst_pts' data layer of the high-resolution terrain data file.

Streamflow on the 2D high resolution routing grid

YYYYMMDDHHMM.CHRTOUT_GRIDX

A netcdf point file containing streamflow discharge at each location in the grid.

Gridded Routing Output

High resolution gridded output (netcdf, not common due to filesize)

YYYYMMDDHHMM.RTOUT_DOMAINX

Channel Inflow

Channel-inflow (ascii Timeseries)

qstrmvolt_accum.txt

Lake/Reservoir Output

Lake/reservoir output (netcdf point file)

YYYYMMDDHHMM.LAKEOUT_DOMAINX

Groundwater/Baseflow

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I
Data Extraction for Tier II Modeling
Project Deliverable ID 1.2.1.4.3.2.1

Groundwater/baseflow output (3 ascii Timeseries files)
 YYYYMMDDHHMM.GWOUT_DOMAINX

Figure3.2: WRF-Hydro Output Data Flow

3.3 NetCDF

NetCDF is the primary multi-dimensional data storage format for *WRF-Hydro* outputs. It is a fully transparent, open source format that has enabled a plethora of *FOSS* data and libraries for both creating and reading the files. The primary data outputs from *WRF-Hydro* of use to *HEC-RAS* models are the channel network output and the gridded streamflow output.

CHAPTER FOUR

HEC-RAS DATA FILES

A HEC-RAS run requires three files: a Geometry datafile containing geometric features and data, a Steady Flow datafile containing flow rates and boundary conditions, and a Steady Flow Analysis (Plan) file, which contains the configuration that HEC-RAS uses to process the data (Figure 4). These files are created via four steps:

1. User-drawn features are created in RAS Mapper.
2. The geometry file is created based on the RAS Mapper contents
3. The Steady Flow datafile is created containing the flow rate at each cross-section in the geometry file, and boundary conditions for the geometric extents.
4. The Steady Flow Analysis is configured.

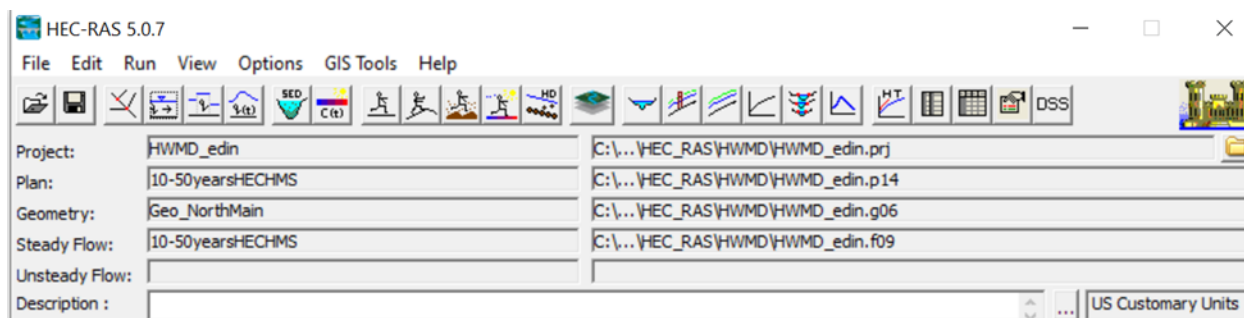

Figure4.1: HEC-RAS Input File Dialog

4.1 HEC Data Storage System

HEC-DSS

The U.S. Army Corps of Engineers' Hydrologic Engineering Center Data Storage System, or HEC-DSS, is a database system designed to efficiently store and retrieve scientific data that is typically sequential. Such data types include, but are not limited to, time series data, curve data, spatial-oriented gridded data, and others. The system was designed to make it easy for

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I Data Extraction for Tier II Modeling Project Deliverable ID 1.2.1.4.3.2.1

users and application programs to retrieve and store data. HEC-DSS is incorporated into most of HEC's major application programs.

pydsstools

pydsstools is an experimental Cython based Python library to manipulate HEC-DSS database file. It supports regular/irregular time-series, paired data series and spatial grid records. It is compatible with 64-bit Python on Windows 10 and Ubuntu like linux distributions. For the later, zlib, math, quadmath, and gfortran libraries must be installed. dssvue python library provides graphical user interface for HEC-DSS. There is also a Rust binding hecdss for HEC-DSS.

4.2 Ingestion Implications

Manual ingestion of CSV data into *HEC-RAS* is certainly possible. Exporting *WRF-Hydro* output data into CSV can be automated, however, the automated ingestion into *HEC-RAS* is uncertain. Considering the potential volume of discharge data that could be transferred from *WRF-Hydro* to *HEC-RAS*, the *HEC-DSS* file structure is likely the most efficient method, however, its format and structure is not readily available to be constructed from scratch. The existence of the *FOSS* *pydsstools* package is promising, however, more due diligence must be expended to ensure its feasibility.

CHAPTER FIVE

POST PROCESSING TOOLS

The following post-processing tools were reviewed for potential data extraction application.

- Integrated Data Viewer by *Unidata*
- RWRFFHydro by *NCAR*

The following test data were used:

Croton, NY

Provided by *NCAR* as a *WRF-Hydro* test case.

LRGV, TX

Produced by *RATES* in the *RGVFlood* implementation strategy.

5.1 Integrated Data Viewer

IDV is a 3D geoscience visualization and analysis tool produced by *UniData*. It is a powerful visualization tool that focuses on the interactive experience and its ability to integrate multiple data sources and type (*WRF-Hydro post processing vizualization*).

5.2 Introduction to R

R is a programming language used for statistical computing and graphical presentation. It's primary potential use in this project is for the analysis & extraction of *WRF-Hydro* data and the creation of input data files for *HEC-RAS*

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I Data Extraction for Tier II Modeling Project Deliverable ID 1.2.1.4.3.2.1

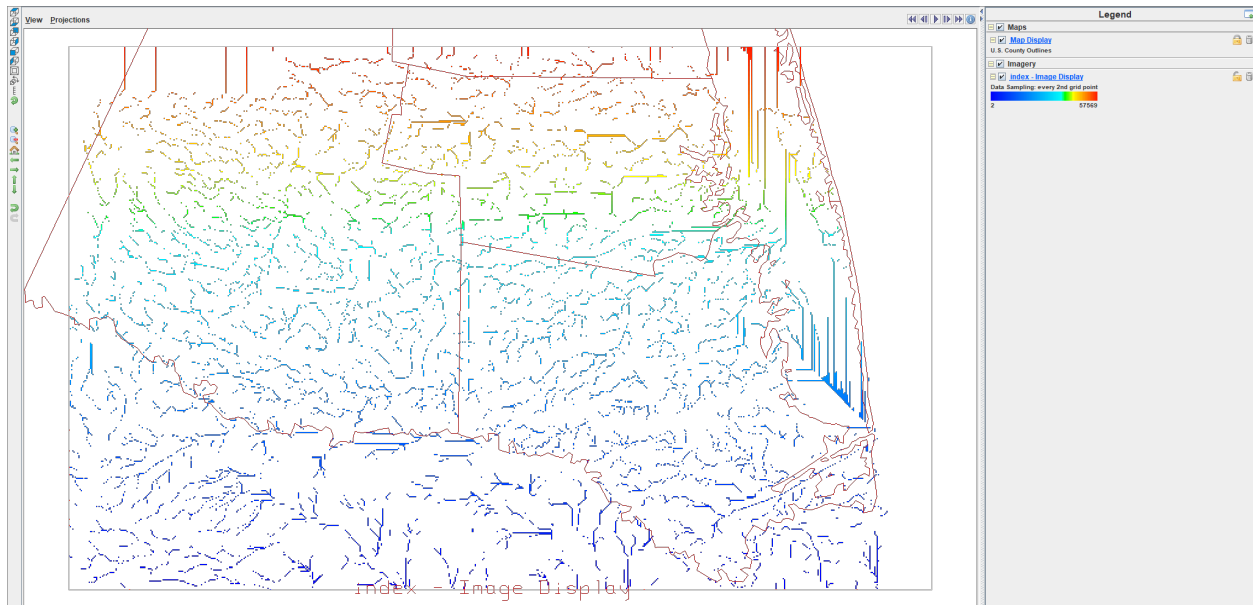

Figure 5.1: LRGV Data Displayed in IDR

5.2.1 Installing on Ubuntu

```
#!/bin/bash
# https://cran.r-project.org/bin/linux/ubuntu/
# update indices
sudo apt update -qq
# install two helper packages we need
sudo apt install --no-install-recommends software-properties-common
→ dirmngr
# add the signing key (by Michael Rutter) for these repos
# To verify key, run gpg --show-keys /etc/apt/trusted.gpg.d/cran_ubuntu_
→ key.asc
# Fingerprint: E298A3A825C0D65DFD57CBB651716619E084DAB9
wget -qO- https://cloud.r-project.org/bin/linux/ubuntu/marutter_pubkey.
→ asc | sudo tee -a /etc/apt/trusted.gpg.d/cran_ubuntu_key.asc
# add the R 4.0 repo from CRAN -- adjust 'focal' to 'groovy' or 'bionic' as
→ needed
sudo add-apt-repository "deb https://cloud.r-project.org/bin/linux/
→ ubuntu $(lsb_release -cs)-cran40/"
# Add the current R 4.0 or later c2d4u repository
sudo add-apt-repository ppa:c2d4u.team/c2d4u4.0+
# update indices
sudo apt update -qq
sudo apt install -y r-base r-cran-devtools
```

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I Data Extraction for Tier II Modeling Project Deliverable ID 1.2.1.4.3.2.1

5.2.2 Basic Concepts

R shows significant potential as a key instrument for transforming *WRF-Hydro* output data into *HEC-RAS* input data. The basic definitions below highlight the key role *R* is expected to play with the *Python* based Clover package developed by *RATES* to manage cloud-based modeling systems.

Vignette

A vignette is a long-form guide to the package. It describes the type of problem it is designed to solve, and demonstrates solutions.

Variables

```
# Assignment using equal operator.
var1 = 3

# Assignment using leftward operator.
var2 <- "learn"

# Assignment using rightward operator.
TRUE -> var.3

print(var1)
cat ("var1 is ", var1 ,"\n")
cat ("var2 is ", var2 ,"\n")
cat ("var3 is ", var3 ,"\n")
```

Functions

```
my_function <- function(fname) {
  paste(fname, "Griffin")
}

my_function("Peter")
my_function("Lois")
my_function("Stewie")
```

Lists

```
vec <- c(1,2,3)
char_vec <- c("Hadoop", "Spark", "Flink", "Mahout")
logic_vec <- c(TRUE, FALSE, TRUE, FALSE)
out_list <- list(vec, char_vec, logic_vec)
out_list
```

Dataframes

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I Data Extraction for Tier II Modeling Project Deliverable ID 1.2.1.4.3.2.1

```
# Create a data frame
Data_Frame <- data.frame (
  Training = c("Strength", "Stamina", "Other"),
  Pulse = c(100, 150, 120),
  Duration = c(60, 30, 45)
)

# Print the data frame
Data_Frame
```

5.3 rwrhydro

A community-contributed tool box for managing, analyzing, and visualizing WRF Hydro (and HydroDART) input and output files in R. ([An overview of rwrhydro functionality](#))

rwrhydro is an *R* package conceived by *NCAR* containing routines and libraries to analyze and visualize *WRF-Hydro* output data. It is named to sound like “*Our* WRF-Hydro”. The routines packaged with rwrhydro form a rigorous basis for integration with the *Clover* package. These routines are well documented in a series of *Vignettes*.

5.3.1 WRF Hydro Domain and Channel Visualization

An example of the the potential for combining functionality from rwrhydro with *Clover* is in the use of the VisualizeDomain routine from rwrhydro within *Clover*. VisualizeDomain creates plots of the WRF Hydro domain files using the rwrhydro routine VisualizeDomain embedded in *Clover* using the rpy2 package. The code block below is what would be used within rwrhydro.

```
library("rwrhydro")
VisualizeDomain("../croton_NY/NWM/DOMAIN/Fulldom_hires.nc", "CHANNELGRID
→")
```

5.3.2 visualize_domain

The visualize_domain method of the *Clover* package embeds the VisualizeDomain routine from rwrhydro using the rpy2 package:

```
clover.fabfile.visualize_domain(geoFile='grid.nc', pngFile='vizdom.png')
```

Plot the domain from the provided NetCDF file

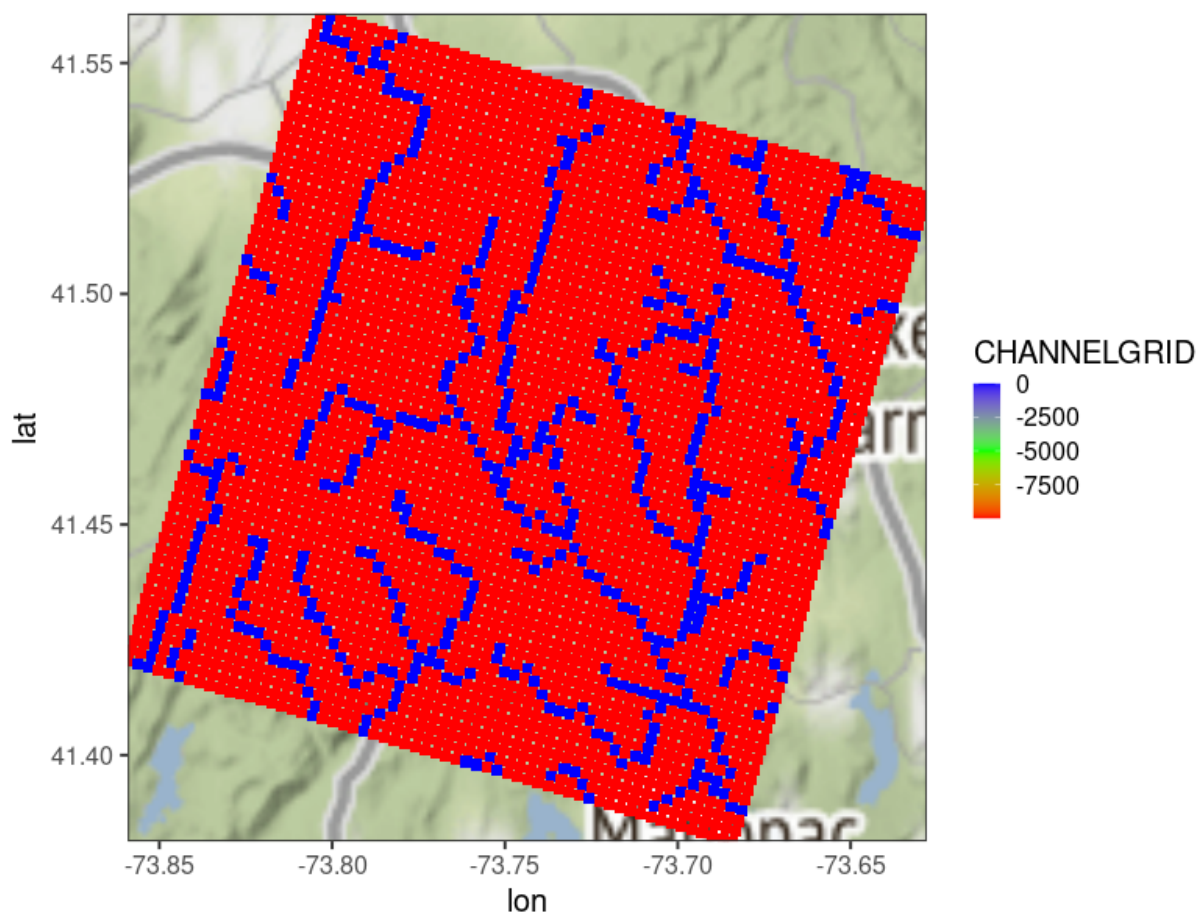

Parameters

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I
Data Extraction for Tier II Modeling
Project Deliverable ID 1.2.1.4.3.2.1

- **geoFile** (*str*) – NetCDF domain file path
- **pngFile** (*str*) – Output PNG file path

5.3.3 Croton, NY Domain

The *Clover* `visualize_domain` is used to visualize the CHRTOUT_DOMAIN output data from the Croton, NY test case.

CHAPTER SIX

IMPLEMENTATION

6.1 Data Extraction Workflow

1. *WRF-Hydro* produces a CHRTOUT_GRID *NetCDF* file at predefined forecast times.
2. *Clover* reads the CHRTOUT_GRID file and extracts the streamflow gridded data.
3. For each available *HEC-RAS* dataset, *Clover* determines the boundary condition needs and populates the next forecast timestep in the appropriate *HEC-DSS* file.
4. When a user triggers a *HEC-RAS* dataset, the updated *HEC-DSS* file is provided.

Figure6.1: Data Extraction Workflow

6.2 Test Data Used

Croton, NY

Provided by *NCAR* as a *WRF-Hydro* test case.

LRGV, TX

Produced by *RATES* in the *RGVFlood* implementation strategy.

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I Data Extraction for Tier II Modeling Project Deliverable ID 1.2.1.4.3.2.1

6.3 Clover

The following sections describe modules provided by the *Clover* package. *Clover* is a comprehensive package that include modules that address *GCP* instantiation, model execution as well as data extraction and ingestion.

6.3.1 fabfile.py

Cloud Virtual Water Model Executioner, a framework for compiling and running selected water models on Google Cloud.

`clover.fabfile.archive_to_bucket(run_folder, bucket_name, name)`

Archive a folder to the bucket and delete it

Parameters

- **run_folder** (*str*) – Folder to archive
- **bucket_name** (*str*) – The bucket to archive to
- **name** (*str*) – The VM

`clover.fabfile.create_godaddy_ip(vmname='ross')`

Create GoDaddy Domain IP

Parameters

vmname (*str*) – vm name

`clover.fabfile.create_instance(vmname='ross')`

Create VM Instances

Parameters

name (*str*) – Virtual Machine instance listed in the config file. Also the VM name

Adapted from: [GCP Create Instance](#)

`clover.fabfile.cxn(vmname='ross')`

Create the connection for the VM

Parameters

vm (*str*) – Virtual Machine defined in the configuration file

Return cxn

Connection object

Rtype cxn

object

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I Data Extraction for Tier II Modeling Project Deliverable ID 1.2.1.4.3.2.1

```
clover.fabfile.delete_instance(vmname='ross')
```

Delete VM Instances

Parameters

vmname (*str*) – Virtual Machine instance listed in configuration file

```
clover.fabfile.get_instance(vmname='ross')
```

Get VM Instance

Parameters

vmname – Virtual Machine instance listed in the config file. Also the VM name

Return instance

Dictionary describing the instance

Rtype instance

dict

Adapted from: [GCP Get Instances](#)

```
clover.fabfile.hecras_files(working_folder)
```

Analyze the available HEC-RAS data files and determine possible applications

Parameters

working_folder (*str*) – Working folder on the model host

Return usable_binary_combinations

Dictionary of lists of plan files useable for each of the Linux Binaries

Rtype usable_binary_combinations

dict

1. Copy the HEC-RAS dataset to the working folder on the model host
2. Check the plan files to make sure the appropriate combinations are available for each of the Geometry Pre-Processor, Unsteady and Steady flow executables
3. Saves the dictionary of usable combinations as a run.toml file in the working directory

```
clover.fabfile.instance_ip(vmname='ross')
```

Get VM Instance IP

Parameters

vmname (*str*) – Virtual Machine instance listed in the config file. Also the VM name

Return ip

IP Address

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I Data Extraction for Tier II Modeling Project Deliverable ID 1.2.1.4.3.2.1

Rtype ip

str, IP Address as a string

Adapted from: [GCP Get Instances](#)

`clover.fabfile.list_godaddy_domains()`

List GoDaddy Domains

Godaddy_account

Goddady Account section listed in the configuration file

`clover.fabfile.load_data(model='HEC-RAS', dataset='Muncie')`

Loads the data onto the model host for ingestion

Parameters

- **model** (*str*) – Model for which the dataset is being located and loaded
- **dataset** (*str*) – The dataset to be loaded
- **datahost** (*str*) – Host where the data resides
- **modelhost** (*str*) – Host where the model resides

Return working_folder

The working folder for remaining operations

Rtype working_folder

str

1. Locate the dataset host
2. Locate the model host
3. Copy the dataset to the working folder on the model host
4. Returns the working folder on the model host

`clover.fabfile.map_grid(fn='grid.nc', pfn='mapgrid.png')`

Plot a WRF-Hydro NetCDF Domain or GRID file and overly on a Basemap. Adapted from [Water Programming: A Collaborative Research Blog](#)

`clover.fabfile.nc_hist(fn='grid.nc', m=0, pfn='nchist.png')`

Plot the streamflow data from a WRF-Hydro NetCDF Domain or GRID file.

`clover.fabfile.nc_hydrograph(dn='/home/anernest/Git/DataExtractor/downloads/WRFHydro_V2_CHRT
rn=1, lat=None, lon=None, pfn='hydro.png')`

Read the streamflow data over time from the GRID files in the gdn directory and plot the hydrograph

`clover.fabfile.nc_outlier_analysis(fn='grid.nc')`

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I Data Extraction for Tier II Modeling Project Deliverable ID 1.2.1.4.3.2.1

`clover.fabfile.nc_stats(fn='grid.nc', m=2)`

Generate the statistics from a WRF-Hydro NetCDF file

`clover.fabfile.ras_geompri(working_folder)`

Run the RAS geometry pre-processor. From [HEC-RAS User Manual \(Geometry Preprocessor\)](#):

The Geometric Preprocessor is used to process the geometric data into a series of hydraulic properties tables, rating curves, and family of rating curves. This is done in order to speed up the unsteady flow calculations. Instead of calculating hydraulic variables for each cross-section, during each iteration, the program interpolates the hydraulic variables from the tables. **The preprocessor must be executed at least once, but then only needs to be re-executed if something in the geometric data has changed.**

Required Files:

- Unsteady Flow Run File (.x??)
- Geometry HDF File (.g???.tmp.hdf)

Parameters

- **vmname** (*str*) – Virtual Machine instance listed in the config file. Also the VM name
- **basin** (*str*) – HEC-RAS Project Name
- **plan** (*str*) – Plan Number

1. Connect to the VM and read the run.toml file
2. Reads the run.toml file for instructions
3. Operates from the timestamped working folder on the specific VM
4. Deletes old outputs
5. Runs the RAS Geometry preprocessor on the Muncie file
6. Copies the output so it can be used by other Runs
7. Archives the run folder to the GCS bucket.

`clover.fabfile.ras_steady(basin='Muncie', plan='04', name='ross')`

Run the Muncie Steady Flow test case. From [HEC-RAS User Manual](#):

Parameters

- **name** (*str*) – Virtual Machine instance listed in the config file. Also the VM name
- **basin** (*str*) – HEC-RAS Project Name

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I Data Extraction for Tier II Modeling Project Deliverable ID 1.2.1.4.3.2.1

- **plan** (*str*) – Plan Number

1. Creates a timestamped test case run folder
2. Copies the Muncie test case to the run folder
3. Deletes old outputs
4. Runs the RAS Steady on the Muncie file
5. Copies the output so it can be used by other Runs
6. Archives the run folder to the GCS bucket.

`clover.fabfile.ras_unsteady(working_folder)`

Run RAS Unsteady Flow. From [HEC-RAS User Manual \(Unsteady Flow\)](#):

The unsteady flow computational program in HEC-RAS uses the same hydraulic calculations (cross section properties, bridge and culvert hydraulics, weirs, gated structures, etc...) that HEC developed for steady flow, however, the solution of the unsteady flow equations (Continuity and momentum equation) are solved using a unique skyline matrix solver developed by Dr. Robert Barkau for his UNET (Unsteady NETwork model) program. The unsteady flow simulation is actually a three-step process. First data is read from HEC-DSS, if necessary, and then converted into the user specified computation interval. Next, the RasUnsteady.exe program runs. This software reads the hydraulic properties tables computed by the pre-processor, as well as the boundary conditions and flow data from the interface. The program then performs the unsteady flow calculations. The final step is a program called RasDSSWriter.exe. This software takes the results from the RasUnsteady.exe run and writes the stage and flow hydrographs to an HEC-DSS file.

Parameters

- **name** (*str*) – Virtual Machine instance listed in the config file. Also the VM name
- **basin** (*str*) – HEC-RAS Project Name
- **plan** (*str*) – Plan Number

1. Connect to the VM and read the run.toml file
2. Reads the run.toml file for instructions
3. Operates from the timestamped working folder on the specific VM
4. Deletes old outputs
5. Runs the RAS UnSteady on the Muncie file

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I Data Extraction for Tier II Modeling Project Deliverable ID 1.2.1.4.3.2.1

6. Copies the output so it can be used by other Runs
7. Archives the run folder to the GCS bucket.

`clover.fabfile.read_nc(fn='grid.nc')`

Read NetCDF Files and display metadata. Adapted from [Read NetCDF Data with Python](#)

`clover.fabfile.remove_hdf5_results(filename)`

Remove the Results from an HDF5 file

Adapted from HEC-RAS Linux Download.

*The file “remove_HDF_Results.py” is a python script for trimming the “Results” data group from the plan HDF file. When an unsteady flow compute is performed in the HEC-RAS GUI v.5.0.7, model information and computed results are stored in the plan HDF file, e.g LeveeBreach.p01.hdf. For the unsteady RAS compute in the CHPS, a *.p01.tmp.hdf is required. The file can be produced by stripping the “Results” data group from the *.p01.hdf file output from the GUI compute and renaming. A simple renaming of the *.p01.hdf to *.p01.tmp.hdf is not sufficient as the rasUnsteady64 program checks for the presence of the “Results” data group and exits if detected.*

The “Results” data group can be removed from the plan hdf file using a small Python program:

C:>python remove_HDF5_Results.py LeveeBreach.p01.hdf

The output of the script is the file, LeveeBreach.p01.tmp.hdf which will become one of the HEC-RAS model files in the Config/ModuleDataSet for the HEC-RAS river system.

*In the v.5.0.3 GUI, the creation of the *.p01.tmp.hdf file could be accomplished by only running the Geometry Preprocessor step in the Unsteady Flow Analysis. This process no longer available in the v.5.0.7 GUI.*

Parameters

filename (*str*) – HDF file to modify

`clover.fabfile.reserve_static_ip(vmname='ross')`

Reserves a static IP

Parameters

project (*str*) – Project ID

Adapted from [GCP Reserve IP](#)

`clover.fabfile.run_wrfhydro(run='CROTON')`

Runs a WRF-HYDRO scenario defined in config.ini. Defaults to the CROTON example case if not specified otherwise.

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I Data Extraction for Tier II Modeling Project Deliverable ID 1.2.1.4.3.2.1

Parameters

run (*str*) – WRF-Hydro scenario to run, defined by the section name of the config.ini read

1. Defines the connection to VM_NAME
2. Downloads and decompresses the example case
3. Copies files from the WRF-Hydro source code to the run folder
4. Copies the data files from the example case to the run folder
5. Runs the NoahMP executable
6. Archives the run folder

`clover.fabfile.timestamp()`

Return a formatted timestamp for logging events

`clover.fabfile.update_godaddy_ip(domain, ip)`

Update GoDaddy Domain IP

Parameters

- **domain** (*str*) – Domain name
- **ip** (*str*) – IP address

`clover.fabfile.visualize_domain(geoFile='grid.nc', pngFile='vizdom.png')`

Plot the domain from the provided NetCDF file

Parameters

- **geoFile** (*str*) – NetCDF domain file path
- **pngFile** (*str*) – Output PNG file path

6.4 Croton NY

The Croton, NY output data was read using the *Clover* `read_nc` module to read and display meta-data from CHRTOUT_DOMAIN output files.

```
201109020000.CHRTOUT_DOMAIN1
<class 'netCDF4._netCDF4.Dataset'>
root group (NETCDF4 data model, file format HDF5):

Figure6.2: Croton, NY Stream Network. Sparsity of points reflect the domain stream locations.

6.4.2 Croton Outlier Analysis

An outlier analysis was conducted on the same dataset. The table below depicts the output of the `nc_outlier_analysis` module. This module re-calculates the dataset simple statistics after filtering data that falls outside the specified number (`m`) of standard deviations, in this case ranging from unfiltered (triggered by `m=0`) and 4. The generally accepted filter of 2 standard deviations (`m=2`) appears function well, indicating that the dataset is reasonably devoid of significant outliers.

====	=====	=====	=====	=====
..	min	max	mean	stdev
====	=====	=====	=====	=====
0	1.62033e-37	8.43465	0.538726	1.25101
1	1.62033e-37	1.69901	0.330557	0.419847
2	1.62033e-37	1.92247	0.340323	0.436626
3	1.62033e-37	3.62963	0.36038	0.505025
4	1.62033e-37	3.62963	0.36038	0.505025
====	=====	=====	=====	=====

6.4.3 Croton Streamflow Distribution (m=0)

The unfiltered streamflow is plotted in the chart below. While the bulk of the streamflow is in the 0-2 cms range, the maximum predicted flow is well within one order of magnitude of the mean flow. This is a reasonable indication that the data is representative of the physical system, and could be ingested as boundary conditions to a *HEC-RAS* model without fear of numerical instability.

6.4.4 Croton Streamflow Distribution (m=2)

The streamflow, filtered within 2 standard deviations, is plotted in the chart below, with all of the streamflow now in the 0-2 cms range. It is, however, likely that the filtered streamflows between 2 and 8 cms are reflective of the physical system and removal of them from the imposed boundary conditions in *HEC-RAS* will negatively affect the accuracy of the hydraulic model output.

Project Deliverable ID 1.2.1.4.3.2.1

Figure6.4: Croton, NY Streamflow Distribution Filtered within 2 Standard Deviations

6.4.5 Croton Hydrograph

The Croton, NY was then plotted against time to produce the hydrograph below. Although the *NetCDF* specifications allow for multi-dimensional data storage, permitting multiple timesteps on the latitude-longitude domain to be stored within one file, this run produces a separate *NetCDF* file for each timestep, likely to account for potential filesystem file-size limitations. The composite data was produced by compiling the data across timesteps, specifying the location in the latitude-longitude domain. In operational mode, these locations would be defined by the *HEC-RAS* boundary condition locations, and/or the locations of the *RTHS* stations.

Figure6.5: Croton, NY Hydrograph

Lower Rio Grande Valley Development Council Flood Infrastructure Fund, Tier I Data Extraction for Tier II Modeling Project Deliverable ID 1.2.1.4.3.2.1

6.5 LRGV TX

The LRGV, TX output data was read using the *Clover* `read_nc` module to read and display metadata from CHRTOUT_GRID output files.

```
202111011300.CHRTOUT_GRID1
<class 'netCDF4._netCDF4.Dataset'>
root group (NETCDF4 data model, file format HDF5):
  TITLE: OUTPUT FROM WRF-Hydro v5.2.0
  model_initialization_time: 2021-11-01_00:00:00
  model_output_valid_time: 2021-11-01_13:00:00
  model_total_valid_times: 2160
  Conventions: CF-1.6
  code_version: v5.2.0
  model_output_type: channel_rt

  proj4: +proj=lcc +units=m +a=6370000.0 +b=6370000.0 +lat_1=20.0 +lat_
→2=60.0 +lat_0=26.235 +lon_0=-96.0 +x_0=0 +y_0=0 +k_0=1.0
→+nadgrids=@null +wktext +no_defs
  GDAL_DataType: Generic
  dimensions(sizes): time(1), x(1400), y(880), reference_time(1)
  variables(dimensions): int32 time(time), int32 reference_
→time(reference_time), float64 x(x), float64 y(y), |S1 crs(), int32
→index(y, x), float32 streamflow(time, y, x)
  groups:
```

6.5.1 LRGV Map-Grid Output

The LRGV, TX CHRTOUT_GRID *NetCDF* datafile was then read using the *Clover* `map_grid` module and displayed in the figure below. Stream thickness is determined by streamflow magnitude. The splotches covering the Laguna Madre are indicative of significant outliers being produced as artifacts of the LRGV domain.

```
/home/anernest/Git/DataExtractor/.venv/lib/python3.8/site-packages/
→matplotlib/collections.py:981: RuntimeWarning: invalid value
→encountered in sqrt
  scale = np.sqrt(self._sizes) * dpi / 72.0 * self._factor
Grid File 202111011300.CHRTOUT_GRID1
```

Project Deliverable ID 1.2.1.4.3.2.1**

Figure6.6: LRGV Stream Network

6.5.2 LRGV Outlier Analysis

An outlier analysis was conducted on the same dataset. The table below depicts the output of the `nc_outlier_analysis` module. Filtering with a reasonable `m` does not appear to improve the dataset, indicating that the distribution is dominated by outliers.

..	min	max	mean	stdev
0	0	12656.1	59.228	629.748
1	0	688.715	7.05464	37.8911
2	0	1318.07	11.7668	77.1795
3	0	1942.36	14.3826	100.29
4	0	2573.13	16.3079	119.551

6.5.3 LRGV Streamflow Distribution (m=0)

The unfiltered streamflow is plotted in the chart below, showing a variability in predicted streamflow of 4 orders of magnitude. The miniscule number of streamflow records at the higher orders of magnitude indicate these to be model artifacts rather than representative of the physical system.

6.5.4 LRGV Streamflow Distribution (m=2)

The streamflow, filtered within 2 standard deviations, is plotted in the chart below, reducing the range by a single order of magnitude. The inadequacy of the filtering method indicates that a more directed filtering or masking technique must be employed to ensure that the resulting data is reflective of the physical system and imposing them as boundary conditions in *HEC-RAS* will positively affect the accuracy of the hydraulic model output.

Figure6.8: LRGV, TX Streamflow Distribution Filtered within 2 Standard Deviations

6.5.5 LRGV Hydrograph

The LRGV, TX data was then plotted against time to produce the hydrograph below. Gridded output from *WRF-Hydro* was generated only in 2015 and 2021, resulting in the depicted data gap.

Figure6.9: LRGV Hydrograph

CHAPTER

SEVEN

CONCLUSIONS

1. A review of *WRF-Hydro* post-processing tools indicate that automated data extraction and ingestion will require development of new modules. These modules are being incorporated into *Clover* and have been successfully demonstrated for data analysis.
2. An assessment of the *HEC-DSS* file format indicates that while the format specifications are not readily available, the existence of a *FOSS* toolset indicates that the creation of *HEC-DSS* for use as *HEC-RAS* boundary condition files is a possibility.
3. An analysis of initial *LRGV WRF-Hydro* output indicates that the presence of model artifacts and outliers are likely to prove problematic if incorporated into *HEC-RAS* boundary condition files unfiltered or unmasked.
